

PhD in Optometry

Objectives:

1. To advance knowledge in the field of optometry through original research.
2. To develop expertise in a specific area of optometry, such as myopia control, low vision rehabilitation, or ocular disease management.
3. To contribute to the development of new treatments, technologies, or clinical practices in optometry.
4. To foster collaboration between optometry and other healthcare disciplines.
5. To produce a thesis that makes a significant contribution to the field of optometry.

Outcomes:

1. Advanced knowledge and understanding of optometric theories, principles, and practices.
2. Ability to design, conduct, and publish original research in optometry.
3. Expertise in a specific area of optometry, enabling the graduate to take a leadership role in academia, research, or clinical practice.
4. Development of critical thinking, problem-solving, and communication skills.
5. Ability to contribute to the development of optometric education, research, and clinical practice.
6. Preparation for careers in academia, research, industry, or clinical practice.
7. Ability to collaborate with other healthcare professionals to advance patient care.
8. Contribution to the advancement of optometry as a profession.
